Episode 4: "The Rebels Who Painted Light"
FULL SCRIPT — DRAFT v4
Movement: Impressionism | Target Runtime: 40–50 min

ACT 1: COLD OPEN

[READ: Begin conversationally, as if sharing an unbelievable fact. Build speed through the rejection, then slow down on the central question. Curious rather than theatrical.]

[TALKING HEAD]

What if I told you that some of the most popular, most reproduced paintings in the world… were made by artists who couldn't even pay rent?

They were broke. They were rejected — over and over. Critics said the work was incompetent and barely even finished. One reviewer thought a painting looked worse than wallpaper.

These same paintings now sell for hundreds of millions of dollars. They hang in the biggest museums on earth. You've seen them on postcards, phone cases, tote bags, coffee mugs — everywhere.

How did that happen? How does a group of rejected nobodies, showing their paintings in a rented studio in 19th-century Paris, end up becoming internationally celebrated to this day?

And what does this have to do with the dress? Yes, *the* dress from the 2015 internet meme. This is not clickbait — I swear there's a real connection.

Let's start from the beginning.

ACT 2: THE DOOR OPENS

[READ: Brisk and explanatory. Let the Courbet recap feel informal; give the comparison room to breathe once the two paintings appear.]

[TALKING HEAD]

I already talked about Gustave Courbet — the artist who basically picked a fight with the entire art world and won.

The Academy and art critics wanted polished compositions and carefully posed heroes. Courbet was like: “I’m gonna paint poor people as if they were as important as kings or gods.”

He helped create the Realist movement and was a truly unapologetic badass for his time — I’ll link the video about him below.

But here’s what Courbet didn’t change: the traditional painting technique. The paint was still layered, the colors were dark, and the compositions were heavy.

He changed **what** was worth painting, but not **how** it was painted.

And that’s where this story begins — when the next generation asked: **what if we change that too?**

Let me show you what I mean.

[SIDE BY SIDE: Bouguereau, The Nut Gatherers (1882) on the left — Monet, Woman with a Parasol (1875) on the right. Hold for 5–6 seconds.]

[TALKING HEAD]

Two paintings. Both made around the same time. Both women outdoors. But they look nothing alike.

The one on the left is by William-Adolphe Bouguereau — one of the most successful, most celebrated painters in France at the time. Look at it: the skin is smooth and perfect, every leaf is in focus, the light is even and controlled. This is what the art establishment considered a masterpiece. This is what won prizes.

The one on the right is by Claude Monet. And to the Salon, to the academy, this wasn’t even a real painting. The brushstrokes are visible. The colors are rough and broken up. Nothing quite holds still: the dress runs into the grass and both seem to dissolve into the sky. It looks like it was painted in twenty minutes in a windy field. Which isn’t far from the truth.

Same era. Similar subject. A completely different way of portraying the world.

This, Bouguereau’s piece. Paintings in a style like this had been the standard for centuries.

But where did Monet’s new, never-seen-before style come from?

Like, how did someone who had only seen paintings like this his entire life even come up with the idea of painting like this?

There are three major reasons. Three pieces of the puzzle that made Impressionism possible: a discovery about how the human eye actually sees color, a small invention that solved a huge problem painters had been dealing with for centuries, and one painter whose scandal gave everyone else permission to break the rules.

The Science of Seeing

[READ: Playful and interactive during the visual game. Slow down for the explanation; sound delighted when the effect becomes visible.]

[TALKING HEAD]

First — the science. That difference you just saw between those two paintings? A lot of it comes down to a discovery that changed how painters think about color.

There was a chemist named Michel Eugène Chevreul. He wasn't a painter — he ran a dye laboratory at a textile workshop in Paris. Workers kept complaining that certain dyed colors looked wrong when placed next to each other.

Now, let's pause for a little game. And don't be smart about it — just play along.

Look at the three circles here. Do they look like they're the same color?

I know, I know — you're probably guessing that they are the same color.

But they don't look the same color. They don't!

Cue the satisfying animation.

So, just like with the circles, the dyes in Chevreul's factory hadn't actually changed — but they *looked* different when placed next to other colors.

Chevreul figured out why. It wasn't the dyes. It was the human eye.

Your eye doesn't see colors in isolation — every color is affected by whatever color is next to it.

OOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO

And here comes the connection to The Dress. Remember that photo that broke the internet? Some people saw black and blue, while others saw white and gold.
This is basically another example of what Chevreul discovered in the 1820s: we don't see color on its own. Our brains judge color based on the colors and light around it.
That's why the exact same dress could look completely different to different people.

The Impressionists became fascinated by this idea — if colors change depending on what's around them, and light changes how we see them, then painting wasn't just about copying what was "there." It was about capturing how a specific moment actually looked. That idea — capturing the passing moment — became central to everything they did.

And this also changed how they painted. Instead of mixing colors into one flat tone, they placed small strokes of different colors right next to each other — and let your eye do the mixing. Up close, it looks like a mess of separate strokes. But step back… and the colors blend, and the painting comes alive.
Cool, right? I've been waiting to do this effect. Let's see it with another painting… Wow.

Next time you're in a museum, go stare at an Impressionist painting up close and then step back and look at it from afar. The scale is one thing, but also, in many artworks, the brushstrokes are thick and textured, and that's something that totally gets lost on a screen.

There was a practical reason for those direct, unblended strokes too. When you're painting outside and the light is changing in front of you, you can't spend forever smoothing every transition. You have to put down what you see before it disappears. And that brings us to the next piece of the puzzle.
The Technology

[READ: Light, tactile and slightly comic at first. Accelerate once the railway and changing light turn painting into a race.]

[TALKING HEAD]

The technology. So now you understand the science behind those bright, broken colors.
But here's the thing — all of those effects depend on light. And light is always changing.
Obviously, a place you see in the morning can look completely different by evening. But even the smallest changes — a cloud passing, or the wind moving the trees around you — can make the colors shift.
Even a white wall can turn from cool blue to warm gold as the day goes on.
The Impressionists were fascinated by this.

The thing is, that's something you can't really recreate in a studio. The light there is controlled and consistent. So if you wanted to truly see how colors change in the world, you had to go outside — watching it happen in real time.

And painting outdoors in the 1840s? That was a total headache.

Before the 1840s, if you wanted to paint outdoors, you had to make your own paint in advance — mixing the pigment with different binding and thickening materials — and then store it in pig bladders.
Yes — pig bladders. So gross.

You'd make a small hole and squeeze out whatever paint you needed, then plug it back up and hope it stayed closed. The whole setup was unreliable and messy. Often, the paint would simply dry inside.
Honestly, I don't know why people went for it. I mean — pig bladders! Ew

Then, around 1841, the squeezable metal paint tube got invented. God bless! Renoir, One of the most famous Impressionists, reportedly said: "Without tubes of paint, there would have been no Impressionism."

He wasn't exaggerating. Take the new convenience of pre-made paint tubes, add railways — you could now take a train from Paris to the countryside in an hour — and suddenly, a painter could stand in a field, in actual sunlight, and paint what they saw.

Today we take that for granted. We can capture a scene instantly with a phone and send the image anywhere. But back then, if you wanted to paint something outside your studio, you had to go there yourself and work fast before the light changed.
If you've ever tried drawing outside from nature, you know what I'm talking about. Shades and colors change so fast. Try drawing a cloud — these bastards move way too fast!

so back then, every painting was a race against time. Not every canvas was completed outside, but the experience of working in changing light transformed the way these artists painted. And that urgency — that feeling of trying to capture something before it disappears — is baked into every Impressionist painting you've ever seen.

Manet

[READ: Shift into story mode. Build tension through the Salon setup; deliver the scandals with amused disbelief, without rushing the explanation of why they mattered.]

[TALKING HEAD]

Third piece of the Impressionist puzzle — the scandal. So the science was there and the tools were there. But there was still a wall in the way: the Salon. The official art exhibition that decided who got seen and who didn't. And as long as the Salon controlled the rules, none of this new thinking about color and light could go anywhere.

That wall needed someone to break it. His name was Édouard Manet. And just to be clear — that's Manet, with an "a." Not Monet with an "o." Two different painters. People mix them up all the time. It doesn't help that they knew each other and worked in the same city. But Manet came first. He's not technically an Impressionist — he never exhibited with them — but he's the one who kicked the door open.

OOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO

Here's what happened. In 1863, the Salon rejected so many paintings that it became a political problem. Thousands of rejected paintings, and a lot of angry artists with no place to show their work. So the Emperor, Napoleon the Third, ordered a separate exhibition of the rejected works, to calm things down.

— imagine how crazy it is that a bunch of angry artists actually got the emperor's attention. Like, how cool is it that art was such a big deal back then?

They called this new exhibition the Salon des Refusés—the Salon of the Rejected.
And Manet showed a painting that instantly caused a scandal.

Luncheon on the Grass — a picnic scene with two fully dressed men and a completely naked woman, staring directly at the viewer. Not a goddess or a nymph — no mythological excuse for showing a naked woman. Just a real, modern woman, looking right at you, daring you to be uncomfortable. Paris was pissed.

Two years later, he did it again — this time at the official Salon. *Olympia* — a naked woman lying on a bed, clearly a sex worker, with a Black servant bringing her flowers. Again: staring at you. No cover story, no context. Just a naked woman and the uncomfortable truth of who she is.

For the art critics, that was *very* hard to swallow. But for the young painters who would become the Impressionists, that was a huge inspiration.
Not necessarily the subjects of the paintings — but the bravery to go further and further away from the Academy's style.
Remember — Gustave Courbet had already changed *what* you could paint. Manet changed also *how* you could paint it. His color was flat, he left some brushwork visible...
For the young artists watching, that became permission to break the rules too.

ACT 3: MONET

[READ: Warm and character-driven. Start with admiration, then lower the energy as Monet's insecurity and poverty enter the story.]

[TALKING HEAD]

So — the science, the tools, and the permission. Those are the three puzzle pieces that created the reality in which Impressionism could happen.

Now let's finally explore the art style itself, by meeting one of its most famous faces — Claude Monet.

He’s one of the most beloved painters who ever lived. His paintings hang in the most famous museums in the world. They sell for over a hundred million dollars.

But for most of his life, he was broke and desperate. The Salon kept rejecting him. There were years when he couldn’t afford paint or feed his family. He wrote letters begging friends for enough money to survive another week. His eventual success took decades, and there was tragedy along the way.

Monet grew up in Le Havre, a port town on the coast of northern France. As a teenager, he was actually making money drawing caricatures — quick, funny portraits of local people. He was good at it. But then a local landscape painter named Eugène Boudin took him outside and showed him how to paint from life — outdoors, in front of the actual subject, in real changing light.

Monet later said: "It was as if a veil was torn from my eyes. I understood what painting could be."

He moved to Paris to study, where he found other young painters who shared the same restlessness. They worked side by side and challenged each other, convinced that painting could become something different.

Monet’s relationship with the Salon was uneven. A few early works were accepted in the 1860s, while more ambitious paintings were rejected. His rough brushwork and unblended colors made his work look unfinished to the academic establishment. What Monet saw as alive, they saw as incomplete. But he kept working, and the work became freer.

In 1872, he painted a small canvas in his hometown. A harbor at dawn, almost swallowed by fog. A few boats become silhouettes on the water, while a blazing orange sun burns through the haze. The painting is so loose it's almost abstract. The brushstrokes are visible. The forms dissolve into each other.

[ARTWORK: *Impression, Sunrise*, full screen, 8–10 seconds]

He called it *Impression, Sunrise*. Just a title — he barely thought about it. But two years later, a hostile critic took the word ‘impression’ and used it to mock the painting. In doing so, he accidentally named the entire movement. Here’s how it haaappened.

OOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO

ACT 4: THE EXHIBITION

[READ: Gather momentum. Make the exhibition feel risky and improvised, then pause on the moment the insult becomes a name.]

[TALKING HEAD]
Monet wasn’t doing this alone. He was part of a wider circle of young painters that had formed by the early 1870s.
These painters didn’t all work alike or even care about the same subjects. But they agreed on one thing: the old system was broken, and they didn’t need its permission anymore.

In April 1874, about thirty of them pooled their money and rented a photographer’s studio on a central street in Paris. They hung 165 works on the walls. There was no jury deciding what was allowed in and no prizes waiting at the end. Just paintings and an open door.

Think about what that means. For decades, the only way an artist could be seen in France was through the Salon — one exhibition, controlled by one jury. Courbet had done it on his own — solo shows of his own work. But this was around thirty artists, working together to build a new system on their own terms.

And then a critic walked in and accidentally gave them a name.

[Beat]

Louis Leroy saw Monet’s *Impression, Sunrise* and wrote a mocking review. He compared it to wallpaper that wasn’t even finished yet. Burn.
He used the word "impression" to make fun of the whole show — as if these weren’t paintings at all, only rough sketches someone had forgotten to finish.

The name stuck: "Impressionists." At first it meant painters who offered only an impression — a first glance rather than a properly finished picture. But the artists gradually accepted the name and turned the insult into an identity.

That immediacy remained visible in the finished work. Instead of polishing away the brushstrokes, they were willing to exhibit canvases that still carried the energy of their making. Their subjects changed too: city streets, cafés, dancers, families, ordinary people outdoors.

But “Impressionist” never meant one strict style. The artists who took part in these exhibitions show just how many directions the movement could take.

There was Edgar Degas — who didn’t even like painting outdoors and would later refuse to be called an Impressionist. But look at his work.

[ARTWORK: Degas, *The Dance Class*, 5–8 seconds]

The Dance Class. The main figure is off to the side. The space is cropped at the edges, unbalanced — like a photograph caught mid-moment. You feel like you walked into the room by accident. Degas wasn’t chasing light like Monet. He was reinventing how a picture is put together — the composition itself was as radical as Monet’s color.

I personally love Degas for his oil pastel paintings that he made a bit later in his career. There, he went even further with deconstructing color and texture.

There was also Pierre-Auguste Renoir, who was fascinated by light and color in outdoor social scenes.

[ARTWORK: Renoir, *Bal du moulin de la Galette*, 5–8 seconds]

Dance at Le Moulin de la Galette. A Sunday afternoon in a popular neighborhood in Paris. Sunlight coming through the trees, falling in patches on the crowd. I'm sure you can vividly imagine the sound of this scene — bubbly chatter, laughter, live music.
Monet chased escaping moments in nature, Renoir explored the feeling and movement of a crowd — the atmosphere of specific social moments.

Mary Cassatt joined the group a few years later. As a woman, she didn't have the same access to art schools or public life as the men did. But these limitations also shaped her work, giving her a unique view of women's lives from the inside.
[ARTWORK: *The Child's Bath*, 8 seconds]

The Child's Bath. A mother bathing a child. Look at the angle — we're looking down from above. We're in the room. We're standing right there. It's so intimate. You can really imagine the weight of the child in the mother's hands, the warmth of her embrace.

In a world where men constantly painted women, Cassatt offered a different perspective — not from across the room, but from within. here's another wonderful example...

OOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO

[ARTWORK: *Little Girl in a Blue Armchair*, 5–8 seconds]

Little Girl in a Blue Armchair. A child sprawled in a chair, bored and restless. She slouches as if nobody is watching. Cassatt doesn't tidy her up or make her sweet for us. She's just a kid being a kid.

Cassatt wasn't the only woman at the center of the movement. Berthe Morisot exhibited in seven of the eight independent exhibitions — more than Monet or Renoir. Their point of view expanded what "modern life" could mean in Impressionist art.

There was also Camille Pissarro — the oldest of the group, and the glue that held them together. He was the only artist who took part in all eight exhibitions they would eventually put together. Pissarro also mentored many of the painters involved in, or inspired by, the

Impressionist movement, including two painters we'll meet in a future video: Cézanne and Gauguin.

Together, these artists showed just how many different directions this new way of painting could take. They weren't all trying to paint the same thing — they were experimenting with what painting could be.

They held eight independent exhibitions between 1874 and 1886. The group was never stable — constant fights about who to include, whether to also submit to the Salon, money, egos. But the principle held: we show our own work, on our own terms.

ACT 5: MONET — THE LONG ROAD

[READ: Pull the energy back. Begin reflectively, become very still for Camille, then rebuild confidence in small steps rather than jumping straight to triumph.]

[TALKING HEAD]

Remember the question from the beginning? How does a group of rejected nobodies become some of the most famous artists in history?
To answer it, we need to go back to 1879, when recognition was still fragile and many of them were struggling.
Let's return to Monet — because his story gets much darker before he finally finds success.

Camille

[READ: Quiet, restrained and compassionate. Leave space after the facts. Do not play the discomfort for comedy.]

[TALKING HEAD — tone shift, quieter]

To understand why Monet's later paintings look the way they do — why they feel so obsessive — you need to know what he went through to get there.
(put cathedral drawings)

There's a moment in Monet's life that says everything about who he was as an artist.

In 1879, Monet's wife Camille died. She was thirty-two. He was at her bedside.

Years later, he described that moment to his friend Clemenceau. He said that as he sat with her in her final moments, he found himself, almost against his will, noticing the colors. The way her

skin shifted. The blue and grey tones appearing. The way light and shadow moved across her face as she slipped away.

He couldn't stop seeing it as a painter. Even in that moment.

He painted her on her deathbed.

[Let that sit]

Exhale. That's creepy... but I don't think we can blame him. He was kind of a victim of his own mastery.

This isn't a story about a cold man. It's a story about someone who sees so deeply that he can't turn it off — not even in the worst moment of his life. That's what it meant to see the way Monet saw. And that way of seeing — that obsession with how light changes everything — is what led to everything that came next.

After Camille

[READ: Begin subdued. Let each date feel like a small step forward; gradually add warmth and momentum as support grows.]

[TALKING HEAD — energy shifts, building]

After Camille's death, Monet kept painting. He moved to a small village called Giverny in 1883 — still poor, renting a house he couldn't really afford. But he kept working.

And slowly — very slowly — things started to change. Not because the Salon changed its mind, but because support was growing around the Impressionists. Critics like Théodore Duret were already defending them in the late 1870s. The ridicule was still there, but serious attention was growing beside it.

The person who did the most to turn that attention into a market was the dealer Paul Durand-Ruel. He had been buying Impressionist paintings since the early 1870s, when almost nobody else would touch them. He believed in the work so strongly that he nearly went bankrupt, but kept arranging exhibitions in Paris and, crucially, brought a large show to New York in 1886. American buyers didn't depend on the Salon to tell them what was good — they saw these paintings and went crazy for them.

That helped turn the tide for the group, and for Monet. He didn't suddenly win over the French establishment. His audience simply kept widening until the Salon was no longer the only path that mattered.

Then, in 1891, Monet did something really unusual — and this time, it was the moment his long, uncertain rise became undeniable.

OOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO

He exhibited a whole series of paintings of the same subject: haystacks.

(leave time for many haystack to apear)

[ARTWORK: Two or three Haystacks side by side — different light conditions]

Twenty-five paintings of the same haystacks. Morning light. Afternoon light. Sunset. Snow. Summer. The haystacks don't change. The light does. And the light changes *everything*.

He said: "For me, a landscape does not exist in its own right, since its appearance changes at every moment."

He's not painting haystacks. He's painting light. The haystacks are just a surface for the light to play on. Remember that idea — capturing a specific, unrepeatable moment of perception? This is what it looks like when someone dedicates their entire life to it.

The exhibition was acclaimed, and the paintings sold quickly.

After years of poverty — and after losing Camille — Monet was finally successful. The man rejected by the Salon over and over, whose work had been dismissed as incompetent and unfinished, had found a way to become a major artist. So of course, he kept going — exploring light, color, and his way of painting, pushing this new way of thinking in bolder directions.

Okay, before we move on, I just wanna stop for a second and think about this. Monet struggled for almost twenty years before he became successful. Twenty years. That's kind of crazy.

And I think there are two things about this that are really worth thinking about.

First, how impressive — but also a little crazy — it is to believe in yourself for that long. We admire that kind of persistence because it worked. But if it hadn't worked, we'd probably call it delusional. So where's the line? How much are you willing to sacrifice for an idea that might never work? When does self-belief become self-sabotage?

And second — and this one is a little more hopeful — success can take way longer than we think. Monet had no idea it would take twenty years. He just kept going without knowing how it would end. And I think that's one of the scariest things about dreaming big: no one can promise you when, or even if, it will work out.

If someone told you your biggest dream would come true in twenty years, would that encourage you or depress you? Anyway, maybe that's why it's always a good idea to enjoy the process too.

And maybe that's exactly what Monet did. He kept painting, kept experimenting, and kept pushing his ideas further.

[ARTWORK: Rouen Cathedral series — two or three versions]

Rouen Cathedral. He rented a room across the street from the cathedral and painted the same stone facade over and over — more than thirty times. In morning light, the stone looks pale blue and purple. By noon, it turns white and gold, with a strong contrast of dark shadows. At sunset, it becomes bright pink.
This is ancient, heavy stone, but Monet makes it seem unstable, ever-changing. The shifting light brings an odd kind of life to the building, giving it a different personality every time.
And then — the Water Lilies.

[ARTWORK: Late Water Lilies — one of the large, almost abstract ones]

[SILENCE — 8 to 10 seconds]

[TALKING HEAD — quiet]

At his house in Giverny, he designed a garden around a water lily pond, with a Japanese bridge crossing it. He literally built the landscape he wanted to paint.

And then he painted it. For thirty years. Hundreds of paintings. The late ones are enormous — six feet tall, fourteen feet wide. And they're almost abstract. There's no horizon line, no solid ground — all that remains are the ever-changing colors of the water and the flowers.

[some quiet time with artworks]

The late paintings get blurrier, the colors shift toward red and yellow. His eyesight was failing — cataracts clouding his vision. He destroyed many canvases he was unhappy with.

But the ones that survived are extraordinary. They point toward abstract art decades before it arrived.

At the Orangerie in Paris, eight massive panels fill two oval rooms. When you walk in, you are completely surrounded by the paintings, almost making you feel like you're standing inside the pond.

It’s a very unique experience, and a little overwhelming. It invites you to stop, take it in, and just let the paintings make you feel whatever they bring up in you.

Monet died in 1926 at the age of eighty-six. He had started as a struggling artist, insisting on looking at the world through his own unique lens. He ended his life as a highly respected painter, living in his own house with a beautiful garden — nearly blind from cataracts, after dedicating his life to the art of looking at light and color.

OOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO

ACT 6: THE LEGACY

[READ: Reflective and spacious at first. Grow more assured through the legacy, then lift the pace for the series recap and next-episode tease. End with warmth, not grandeur.]

[TALKING HEAD — direct to camera]

By the early nineteen-hundreds, the Impressionists were no longer outsiders. Durand-Ruel’s exhibitions and network of collectors helped several Impressionists build reputations outside the Salon. Some became famous and financially secure; others continued to struggle. The group itself broke apart after its final exhibition in 1886.

But the movement didn’t disappear when the group did. Its audience kept growing. By the early nineteen-hundreds, museums were collecting their work and prices were rising. Today, people line up to see the same paintings critics dismissed as incompetent and unfinished.

So why is the Impressionists’ story so important for art history?

They proved that there’s more than one way to make a painting — and that nobody gets to decide which way is the right one.

They expanded what a finished painting could look like. A visible brushstroke didn’t have to be a mistake — it could be intentional. A quick outdoor sketch could matter as much as a polished studio painting. A wild, expressive exploration of texture and color could be just as important as a complicated composition filled with well-known characters.

And maybe even more important than the style is what they proved about the system. If the Salon and its jury wouldn’t let them in, they could rent a room and show the work themselves. They didn’t have to wait for permission.

That may be their biggest legacy. They didn’t replace the Academy’s rules with one new formula. They broke the idea that there had to be only one path at all.
And maybe because of their courage — and their refusal to give up — we can now enjoy the huge variety of art we see today.

[Beat]

So, can you see how everything starts to pile up?
Neoclassicism played by the old rules of the Academy — rational, structured compositions, showing traditional themes.
Romanticism brought intense emotions and dramatic settings.
Realism challenged the idea of what subjects are worthy of being painted.
And Impressionism changed how paintings could be made — evolving the way artists explored both subjects and style.

So, you guessed it — the very next generation brought their own changes to the art world. They looked at Impressionism and felt it still wasn't enough. They wanted art to go beyond the exploration of light and color and become more personal, even unsettling.

One of them abandoned normal brushstrokes and painted with thousands of tiny dots, creating an entirely new way to use color. Another painted the same mountain over and over and over and over, until he found a completely new way to see it. Another abandoned his whole life for art and moved to a tiny island on the other side of the world. The fourth never sold a single painting during his lifetime — yet became one of the most famous artists who ever lived. You might not know his story, but you've definitely seen his art.

These four artists redefined the direction of modern art. And not one of them lived to see it happen.

That's next time.
ok byeee.

[Cut to black.]

END OF EPISODE 4
